The Journal of Techniques is an open access journal interdisciplinary peer-reviewed journal that calls for research work in different technical fields of imposing sciences. The journal deals with the state-of-the-art research in engineering, and requests both theoretical and/or practical works that can tackle the limitations and challenges of the latest developments in different fields of engineering techniques. Therefore, the journal aims to publish original and high-quality research papers in techniques of the engineering fields. The articles must be original writing that improves the current form of knowledge in the specified subject area. Applied articles are adequate if they are valuable to the engineering society on how to present technology or methodology that is novel. Survey, research reports, express communications, and review articles are acceptable if they present useful efforts. The journal seeks experimental and practical work that can overcome the limitations and drawbacks of gaps in the latest research in different fields of engineering. Moreover, the journal will publish work regarding simulation results and practical case studies. The topics considered include, but are not restricted to, electrical and electronic engineering, communications engineering, computer engineering, control and automation engineering, laser and optics engineering, medical engineering, biomedical engineering, mechatronics, mechanical engineering, material engineering, nanotechnology, thermal engineering, energy and renewable energy, chemical engineering, petroleum engineering, civil and structural engineering, surveying and geomatics engineering, water-resources engineering, environmental engineering, safety, risk management and quality, architecture, and technical education.

The researchers' attention in this journal should be achieved to attaining a good academic reputation. Therefore, the progress towards publishing noteworthy additions to scientific, technical knowledge must be ongoing. It is expected that the journal would be subjected to a strict assessment by the journal indexing databases policies. Summarizing or replication of the work of others is not conveying to increase the human information. Therefore, the valuable added values of the techniques and research are welcome to be published in this journal.

Research in engineering disciplines is preferred to be of an applied nature. If they are simulated, they should be reinforced by new or developed mathematical equations, taking into account the accuracy of reference or the primary reference to enhance scientific honesty and clear transparency. In addition, because of the substantial technological development, engineering research should take into account

these developments to add inputs that improve these developments and contribute to finding proposals for solving the problems facing those developments. The results of the research should be marked with the apparent reference to the programs used and its version with precise detail of the algorithms used and mention of its original reference in addition to clarifying the development joints contributed by the researcher. The results must be preceded by a clear framework for the model used with a list of variables and the parameters with the corresponding values suggested by the researcher and clarification of the methods of choosing those values and the reasons for choosing them. On the other hand, the author's must adopt highly reliable references published from internationally recognized publishers with clear global symbols.
